3. React is a javascript library how use components to render things and a component renders content by returning some JSX.

4. The Virtual-DOM is the API how used to perform the actual rendering on a web page of the navigator.

5. The JavaScript XML is HTML markup mixed with custom tags for the React components.

6. A component can be a function or a class how render and return something.

```
class Welcome extends React.Component {  
  render() {  
    return <h1>Bonjour, {this.props.name}</h1>;  
  }  
}
```

7. I can use node with node-modules, if i want to add Bulma to my React App i just have to type in the console "npm i bulma" and this will be added to the node-modules of my applications. After that i will be free to import in the project. "import 'bulma/css/bulma.css'".
